ABSTRACT

The antibacterial activity of plant Solanum xanthocarpum belonging to family Solanaceae, was evaluated in-vitro against some selected human pathogenic microorganisms (Escherichia coli, Yersinia pestis, Pseudomonas aeruginosa and Staphylococcus aureus) following agar-well diffusion method using different concentrations (30%, 50%, 70% and 100%). Two solvents methanol and acetone were used for extraction of different bioactive constituents from fresh leaves. It was concluded from the results that methanolic as well as acetone leaf extracts of S. xanthocarpum were quite effective in inhibiting the growth of Staphylococcus aureus which is a serious human pathogen causing infections in wounds. Therefore, the leaf extracts of this plant can be selected for further investigation to determine their therapeutic potential.

Keywords

Solanum xanthocarpum, Leaf extracts, Antibacterial activity, Agar-well diffusion.

Introduction

Nature had bestowed us with a large variety of medicinal plants. The use of plants for medicinal purposes can be traced back to our history. There exists an abundant knowledge, information and benefits of herbal drugs in our ancient literature of Ayurveda (Traditional Indian Medicine) (Gagandeep et al., 2010). In developing countries and especially in India low income people such as farmers, people of small isolated villages and native communities use folk medicine from some plants for the treatment of common infections (Fabricant and Farnsworth, 2001). These plants are ingested as decoctions, teas and juice preparations to treat various infections. They are also made into a poultice and applied directly on the wounds or burns. Traditional healers consider these medicines as much cheaper and more effective than modern medicines (Abhishek et al., 2010). Plants have a long history of potential antibiotics for the cure of diseases by antimicrobials, including antiviral, antibacterial and antifungal agents. Indians have been utilizing crude plants as source of medicine since ancient time. This property is primarily due to the bioactive compounds synthesized during secondary metabolism in plants. According to World Health
Organization (WHO), medicinal plants are the best source to obtain variety of drugs. About 80% of individuals from developed countries use traditional medicines which has bioactive compounds derived from medicinal plants hence such plants should be investigated further for better understanding of their properties, safety, efficacy and efficiency (Gavimath et al., 2012). The present investigation is aimed to focus on the antibacterial activity of leaves of a valuable medicinal plant Solanum xanthocarpum.

S. xanthocarpum is known as Indian night shade or yellow Berried Night Shade plant. The common name is Kantakari synonym Solanum surattense and belongs to family Solanaceae. The plant is rich in many ingredients like alkaloids, phenolics, flavonoids, sterols, saponins and their glycosides and also carbohydrates, fatty acids, tannins and amino acids. The plant is known for its medicinal benefits since time memorial. Roots, leaves, stems, flowers and fruits are useful parts of Ayurvedic medicinal herb. Its roots are one of the important constituents of well known Ayurvedic preparation “Dasmula Ashva” (Amir and Kumar, 2004). Studies indicate that S. xanthocarpum possesses antifertility, antipyretic, anticancer, antiallergy, anti-inflammatory, antihistamine, hypoglycemic, antibacterial, antioxidant, antifungal properties (Yoshida and Oudhia, 2006)

Materials and Methods

Collection of Plant Material

Leaves of S. xanthocarpum were collected from village Kaloha, District Kangra, Himachal Pradesh, India. The collected plant material was brought to the laboratory for further analysis.

Processing of Plant Material

The collected S. xanthocarpum’s leaves were plucked from the plant and washed thoroughly under tap water and then with 2% Mercuric chloride. The leaves were cut into smaller pieces for quick drying. Cleaned leaves were shade dried for 15-20 days. The dried plant material was crushed into fine powder with the help of pestle mortar. Finally the fine powder was stored in air tight container at room temperature.

Preparation of Methanolic and Acetone Leaf Extracts of Solanum xanthocarpum

The dried leaf material (50 g) was pulverized in a blender to get a coarse powder and soaked separately in 300 ml of methanol and acetone separately in Erlenmeyer flask. The flasks were covered with aluminium foil and allowed to stand for 3-5 days for extraction. These extracts were filtered through Whatman filter paper no. 1 and evaporated at 40°C using rotary evaporator. The extracts were collected and stock solution of conc. 50 mg/ml was prepared.

Procurement of Bacteria

Bacterial strains used for determining antimicrobial activity of leaf extracts of S. xanthocarpum procured from Department of Biotechnology, Himachal Pradesh University, Summer Hill Shimla, India. Pathogens used for the study were Escherichia coli, Staphylococcus aureus, Pseudomonas aeruginosa and Yersinia pestis.

Revival of Pathogen

The collected pathogens were revived in nutrient broth and stored in nutrient agar slants at 4°C.
Screening the Antibacterial Activity of Methanolic and Acetone Extracts of Solanum xanthocarpum

Screening of leaf extract (methanol and acetone) of Solanum xanthocarpum was done using agar-well diffusion method. Nutrient agar medium (Beef extract 1g, Yeast extract 2g, Sodium Chloride 1g, Peptones 5g, Agar 20g, Distilled Water 1000 ml) was used throughout the investigation. The medium was autoclaved at 121.6°C for 30 minutes and poured into petriplates. Bacteria were grown in nutrient broth for 24 hours.

A 100µl of bacterial suspension was spread on each nutrient agar plate. Agar wells of 8 mm diameter were prepared with the help of sterilized stainless steel cork borer in each petriplate. The wells in each plate were loaded with 30%, 50%, 70% and 100% concentration of prepared extracts of Solanum xanthocarpum. The petriplate kept as control contained pure solvent in the well. The plates were incubated at 37±2°C for 24 hours in the incubation chamber. The zone of growth inhibition was calculated by measuring the diameter of the inhibition zone around the well (in mm) including the well diameter. The readings were taken in perpendicular direction for all the three replicates and the average values were tabulated. Percentage inhibition of growth of bacterial microorganisms was calculated after subtracting control from the values of inhibition diameter using control as standard (Hemashenpagam and Selvaraj, 2010).

Percentage of growth inhibition= (Control-Test/Control) x100

Control=average diameter of bacterial colony in control.

Test=average diameter of bacterial colony in treatment sets (Kannan et al., 2009).

Results and Discussion

The present study brings out that methanolic and acetone leaf extract of Solanum xanthocarpum proved itself as good antibacterial agent. The methanolic extracts of S. xanthocarpum showed considerable growth inhibition of test bacteria at different concentrations (30%, 50%, 70%, 100%) as compared to acetone leaf extract of the plant. The methanolic extract of Solanum xanthocarpum was found to be most effective against S. aureus at (18mm at 100%) followed by (15mm at 70%), (13mm at 50%), (11mm at 30%), and it offered minimum inhibition in P. aeruginosa (13mm at 100%), (11mm at 70%), (9mm at 50%) and (9mm at 30%) as given in table 1. The acetone extract of Solanum xanthocarpum was found to be most effective against S. aureus at (16mm at 100%) followed by (14mm at 70%), (13mm at 50%), (10mm at 30%), and it showed minimum inhibition towards P. aeruginosa (12mm at 100%), (11mm at 70%), (9mm at 50%) and (Nil at 30%) as shown in table 2.

It was concluded from the results that methanolic as well as acetone leaf extract of S. xanthocarpum were quite effective in inhibiting the growth of Staphylococcus aureus which is considered as a serious human pathogen causing infections in wounds. Possible reason for this antibacterial activity of S. xanthocarpum are presence of alkaloids, phenolics and flavanoids in its leaves (Abhishek et al., 2010). Majority of phytochemical components are known to produce the therapeutic activity like antibacterial, antifungal and antioxidant etc. (Sahoo et al., 2010). These finding are in accordance with the work carried out by Salie (1996) and Kannabiran (2009). It has been established that our work also coincide to the work already reported by Aliero and Afolayan.
Our study was also found to correlate with the results of on phytochemicals extracted from the leaves of *S. xanthocarpum* (Kumar et al., 2003). Thus it serves as an encouragement towards development of new drugs for the benefit of mankind.

**Table.1** Percent Inhibition of Growth of Human Pathogenic Bacterial *spp.* at different Concentrations of Methanolic Extract of *Solanum xanthocarpum*

| Concentration of methanolic extract of *S. xanthocarpum* (In %) | Inhibition zone diameter (In mm) |  |
|---|---|---|---|---|
|  | *S. aureus* | *E. coli* | *Y. pestis* | *P. aeruginosa* |
| Control | Nil | Nil | Nil | Nil |
| 30 | 11 | 9 | 9 | 9 |
| 50 | 13 | 10 | 10 | 9 |
| 70 | 15 | 13 | 13 | 11 |
| 100 | 18 | 15 | 15 | 13 |

Each data represent mean of three replicates.
