ABSTRACT

An experiment entitled “Response of gladiolus growth, flowering and corm to *Trichoderma* and varieties” was carried out at Horticulture Research Farm, Department of Horticulture, Institute of Agricultural Sciences, Banaras Hindu University, Varanasi, (U.P.), during 2017-2018. Experiment consisted of eight varieties of gladiolus namely Yellow Jester, Tiger Flame, Punjab Morning, Punjab Dawn, Pusa Kiran, Shubhangini, IIHR, and Dhanvantri and application of *Trichoderma* i.e. treated and control. Thus there were sixteen treatment combinations. Experiment was laid out in Randomized Block Design with three replications. Application of *Trichoderma* was found beneficial for plant growth and flowering characters. Plant treated with *Trichoderma* show maximum width of leaf and plant height at 60 days. The width of scape also influenced by *Trichoderma* but there was no any significant effect of *Trichoderma* on width of scape. Plant treated with *Trichoderma* show maximum rachis length and longevity of 5th floret. Days to colour show, longevity of 3rd floret and number of open floret without withering first floret are influenced by *Trichoderma* but there was no any significant influence of *Trichoderma*. Among different varieties cv. Shubhangini recorded maximum width of leaf at 60 days, whereas in cultivar Yellow Jester exhibited maximum width of scape. The maximum plant height was recorded in cultivar Dhanvantri. The maximum longevity of 3rd and 5th floret was recorded in cultivar Yellow Jester and maximum number of open floret without withering first floret recorded in cultivar Dhanvantri. However maximum rachis length and minimum days to colour show exhibited by cv. IIHR.

Introduction

Gladiolus is a bulbous ornamental plant that belongs to the family Iridaceae. In commercial floriculture, bulbous ornamental crops are an important group of plants and are considered as the wealth of the country. Gladiolus is an important commercial flower crop and is very popular as cut flower both in domestic and

international market. Gladiolus was introduced into cultivation towards the end of sixteenth century. The flowers are used in flower arrangement, in bouquets and for indoor decorations (Singh and Sisodia, 2017). There are over 30,000 varieties of gladiolus. These have mostly been evolved through conventional breeding in USA, The Netherlands, UK, Canada, Russia, Australia,

Slovakia, Poland, Japan, New Zealand and India whereas a few through mutation breeding in USA, The Netherlands, Russia, Hungary and India (Singh, 2006). All the varieties may not perform well in a region. Therefore, evolution of some promising varieties for a specific region is important. To boost up the yield potential use of bio-agents like *Trichoderma* plays an important role in enhancing the flowering and growth parameters in gladiolus. Therefore, present investigation has been planned to study the response of gladiolus plant growth and flowering attributes to *Trichoderma* and varieties.

Materials and Methods

The experiment was carried out at Horticulture Research Farm of the Department of Horticulture, Institute of Agricultural Sciences, Banaras Hindu University, Varanasi, which is situated at 25° 02' North latitude, 83° 03' East longitudes and at an elevation of 128.93 meters above the sea level. Eight varieties of gladiolus (Yellow Jester, Tiger Flame, Punjab Morning, Punjab Dawn, PusaKiran, Shubhangini, IIHR, and Dhanvantri) were treated with *Trichoderma* and also control corms were untreated. Thus, there were sixteen treatment combinations.

Treated and untreated corms were planted with spacing of 30 cm between the rows and 20 cm between the plants during December 2017. The experiment was laid out in Randomized Block Design with three replications. Uniform cultural practices were done for all the varieties. Observations were recorded on various growth and flowering parameters and data were analyzed statistically.

Results and Discussion

Growth characters

Various growth parameters influenced significantly due to *Trichoderma* and

gladiolus varieties (Table 1). Width of leaf and plant height at 60 days after planting of corms was statistically higher with *Trichoderma* treatment in comparison to control. However, application of *Trichoderma* fails to exert any conspicuous effect on width of leaf at 30 days, width of scape at 30 and 60 days and height of crop at 30 days. Although maximum leaf width and plant height was noted in *Trichoderma* treated plant as reported by Dongardive *et al.*, (2007) and Dubey *et al.*, (2008). Singh and Sisodia (2015) and Singh *et al.*, (2016) also found beneficial effect of *Trichoderma* in combination with FYM and Vermicompost in gladiolus crop.

All the growth character influenced significantly due to varieties of gladiolus. It is interested to note that maximum width of leaf at 30 days was recorded in cultivar Pusa Kiran followed by IIHR and at 60 days cultivar Shubhangini exhibit maximum leaf width. The maximum width of scape at 30 days was noticed in cultivar Yellow Jester followed by Dhanvantri and at 60 days maximum width of scape was recorded in cultivar Yellow Jester followed by Shubhangini. Maximum plant height at 30 and 60 days recorded with cultivar Dhanvantri which was statistically higher than other varieties. There is wide variation in plant height among the varieties is mainly due to genetic nature of germplasm. Present finding are also in close conformity with the observation made by (Singh *et al.*, 2013a) in tuberose, Singh and Sisodia (2015) and Sisodia *et al.*, (2015) in gladiolus.

Flowering parameters

Different flowering parameters were influenced significantly due to *Trichoderma* and gladiolus varieties (Table 2). The plant treated with *Trichoderma* exhibited maximum longevity of 3rd floret but there was no any significant effect, whereas the maximum longevity of 5th floret was noticed in *Trichoderma* treated plant. *Trichoderma*

treated plant show maximum number of open florets without withering of lower floret, but there was no any significant effect. The rachis length was noticed influenced significantly by *Trichoderma*. However, application of *Trichoderma* fail to exert any pronounced effect on days to colour show, longevity of 3rd floret and number of open florets without withering of lower floret. Beneficial effect of application of *Trichoderma* was also reported by Anuje *et al.*, (2004) and Atta-Alla *et al.*, (2003).

All the flowering parameters except number of open florets without withering of lower floret were influenced significantly due to varieties of gladiolus. Minimum days to colour show was recorded in variety IIHR followed by cv. Punjab Morning, whereas cultivar Tiger Flame was most late to colour show. There is variation in days to colour show among different cultivar as reported by and Singh *et al.*, (2017). The maximum longevity of 3rd

floret was recorded in cultivar Yellow Jester which was statistically at par with cvs. Tiger Flame, Pusa Kiran and Shubhangini are significant to all other varieties. Whereas, cultivar Yellow Jester exhibited maximum longevity of 5th floret followed by Tiger Flame. The maximum number of open floret without withering first floret was recorded in cv. Dhanvantri followed by cv. Tiger Flame. The maximum rachis length was noticed in germplasm IIHR which was statistically at par with Pusa Kiran and significant to all other varieties. Difference on floret length was also found in gladiolus varieties (Fig. 1). Maximum length of 1st floret was exhibited with cv. Dhanvantri, whereas 3rd and 5th floret was maximum in germplasm IIHR. Variation in floret and spike length might be due to variation in their intrinsic factor as reported by various previous workers (Rani and Singh (2005), Pragya *et al.*, (2010), Singh *et al.*, (2017).

Table.1 Response of gladiolus growth to *Trichoderma* and varieties

| Treatment | Width of leaf at 30 days (cm) | Width of leaf at 60 days (cm) | Width of scape at 30 days (cm) | Width of scape at 60 days (cm) | Plant height at 30 days (cm) | Plant height at 60 days (cm) |
|---------------------------|-------------------------------|-------------------------------|--------------------------------|--------------------------------|------------------------------|------------------------------|
| Bio-agent | | | | | | |
| Control | 1.87 | 2.23 | 1.41 | 1.83 | 30.94 | 45.37 |
